Tactical Electronics

MONITORS

The Monocular Micro Viewer is a four channel, single eyepiece monitor that can be attached to a lanyard and hung around the neck. The MMV displays b/w video transmitted directly from the camera source.

MMV

- All Tactical Electronics cameras and monitors have been designed to operate interchangeably. If you have multiple Tactical Electronics camera systems, the monitor will toggle between a maximum of four channels.

Each monitoring option has a built-in receiver, and when powered "ON" automatically receives RF video signals from any Tactical Electronics camera system.

The Handheld Monitor has a 5.0" LCD screen that displays b/w or color video images from the camera source.

HHM

The Handheld Monitor is powered by four 3V Lithium batteries, AC, or vehicle power via cigarette lighter plug.

HUD:

The Heads-Up Display gives the operator the appearance of a 35-inch screen at a 7 foot distance. The HUD displays b/w or color video transmitted directly from the camera source.

WMM

The Wrist Mounted Monitor has a 2.5in LCD screen that displays b/w or color video transmitted from the camera source.
